

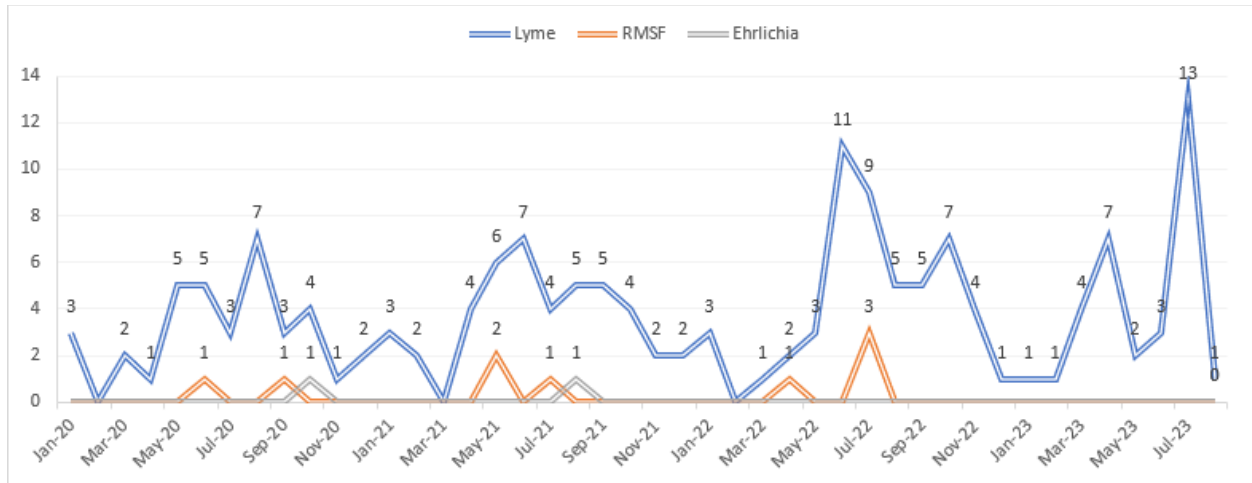

Figure 1. Test results for Lyme disease, Rocky Mountain Spotted Fever (RMSF) and Ehrlichia infection at CCHMC.

*Note: Some external lab tests are not included. This figure represents only positive results and not if a given test was considered a false positive or false negative in which treatment may have been given/deferred. A Lyme positive was only counted if the Western blot or PCR was positive (not the initial screen). Other tickborne infections such as babesiosis and anaplasmosis were evaluated for but no cases were found and so not included in the graph.
